I. Executive Summary

Recognizing that literacy is fundamental to learning, skill acquisition, and success in primary school and beyond, education stakeholders are increasing their focus on the assessment of early grade reading skills. The Early Grade Reading Assessment (EGRA) is an oral student assessment designed to measure the most basic foundational skills for literacy acquisition in the early grades: recognizing letters of the alphabet, reading simple words, understanding sentences and paragraphs, and listening with comprehension.¹ The EGRA methodology was developed under EdData II, and has been applied in more than 30 countries and 60 languages.²

All Children Reading: A Grand Challenge for Development (ACR GCD), a joint partnership between the United States Agency for International Development (USAID), World Vision, and the Australian Government, Department of Foreign Affairs and Trade (DFAT), has adopted the standard EGRA to systematically assess reading skills across all Round 2 grantees. The instrument is adapted according to each grantee's project context.

Agora Center, University of Jyväskylä, an ACR GCD Round 2 grantee, conducted an EGRA baseline assessment in 30 schools in the Eastern Province of Zambia. This was done in collaboration with their local partner, Centre for Promotion of Literacy in Sub-Saharan Africa (CAPOLSA), University of Zambia, and School-to-School International (STS).

The results of the baseline data collection, conclusions, and recommendations are presented in this report. Below is a summary of the key findings.

Key Findings

1. The **majority of students in this sample lack foundational reading skills needed to decode simple one- and two-syllable words**, as seen in the Nonword Reading subtask. On this subtask, more than 92 percent of students received zero scores, indicating that they could not correctly identify any of the nonwords presented.
2. **Students in the sample are unable to read with fluency**, as seen in the Oral Reading Fluency (ORF) subtask. The mean score for all students on this subtask was less than one correct word read per minute, and on the same subtask, over 87 percent of students were unable to read a single word.

Reading Comprehension	0.2	282	0.2	267	0.2	549
Listening Comprehension	2.9	1	2.7	3	2.8	4

II. Project Description

The GraphoGame™ Teacher Training Service (GG-TTS) is designed to provide a cost-effective, scalable mobile-based teacher training model for supporting struggling readers. This teacher training model is designed to support the national literacy framework used by the Ministry of General Education in Zambia.

GG-TTS is based on previous research on the use of digital literacy games for supporting early grade reading skills in Zambia. The first pilot projects on the use of digital literacy games were conducted in 2005 with an early version of a computer game that was later developed into the current GraphoGame™ (GG).³ Graduate students in Lusaka conducted additional pilot projects and found that children’s orthography and spelling skills improved after playing the game for about two hours during one month of intervention.⁴ Additional research was conducted in 2010 through the Reading Support for Zambia (RESUZ) project in which PhD students conducted an intervention with an early version of GG using basic Nokia phones. **The results⁵ showed that the GG intervention was most effective when the teachers also used the game instead of just providing the game for the children to play.** In 2013, three implementation models testing GG playing sessions at schools and on tablets were studied^{6,7}, and increases in the basic reading skills of GG participants were found in all treatment groups.

In 2014, GG was piloted with smartphones in rural schools in the Eastern province of Zambia. In this experiment, teachers from 24 schools participated in a three-day workshop on the use of GG and also received information about the new curriculum and methods of supporting struggling readers. Teachers used GG themselves and provided GG for their students either at school or by giving GG phones to students for home-use. The latter scenario provided children's adult family members the opportunity to play the game. This study did not include pre- and post-testing of the children's literacy skills, but GG's internal assessments showed increases on the Letter-sound and Word Recognition assessments for both children and adult users, as well as small increases for the teachers.⁸

Building upon previous research and lessons-learned, GG-TTS aims to benefit Grade 2 students who performed below or at minimum standards of literacy at the end of Grade 1, with the goal of providing them with an early intervention to help them catch up with their classmates that acquired adequate literacy skills in Grade 1. This goal is particularly important because students who have not acquired these skills by the end of Grade 1 may be disadvantaged as they progress in the education system. GG-TTS intends to reach this goal through Grade 2 teachers who complete the following tasks:

1. Receive training on the use of GG in their classroom.
2. Complete online training via the GG-TTS website focused on literacy instruction in mother tongue languages and supporting struggling readers.
3. Review additional materials on the GG-TTS website, as needed, on literacy instruction in mother tongue languages and on how to support struggling readers.
4. Administer GG to struggling readers in their classrooms.

GG-TTS will be implemented in 30 schools in the Katete district in the Eastern province of Zambia. Teachers participating in GG-TTS are provided with GG-equipped mobile phones to be used with their students. They are instructed to provide two GG playing sessions per week to each of the students in the treatment group. GG is used at a maximum of 15 minutes per session, which allows the teacher to use the same mobile phone with four children per hour. GG sessions are continued until the minimum recommended exposure time of three hours is reached and/or the student reaches 100 percent progress scores in all the game learning materials (identifying letter-sounds, syllables and words). Teachers are also responsible for ensuring children log in with the correct player account and for keeping track of each players' progress through the GG results analytics tool on the phones. Teachers send the game logs that are automatically saved as records to GG-TTS staff each Friday for online monitoring of the intervention. Teachers who complete their training components and who submit their GG game logs receive a certificate, which serves as an incentive to participate fully in GG-TTS.

III. Purpose

The purpose of the project is to study how GG-TTS can improve the ciNyanja literacy skills of Grade 2 students. The two main research questions are:

⁸ Ojanen, E., Ronimus, M., Ahonen, T., Chansa-Kabali, T., February, P., Jere-Folotiya, J., . . . Lyytinen, H. (2015). GraphoGame – a catalyst for multi-level promotion of literacy in diverse contexts. *Frontiers in Psychology*, 6, 671. doi:10.3389/fpsyg.2015.00671

1. Does GG-TTS help improve early grade literacy instruction in ciNyanja, as measured through literacy acquisition among students?
2. Can the online GG-TTS materials (accessed via mobile phones) help rural Zambian teachers to utilize new methods for ciNyanja literacy instruction?

IV. Evaluation Design and Methodology

To measure the results of GG-TTS, an Early Grade Reading Assessment (EGRA) will be conducted in three phases: a baseline assessment, a midline assessment, and an endline assessment. The baseline was conducted at the beginning of the academic year in January 2016 and measured student reading levels at the end of Grade 1 prior to entering Grade 2. Midline data collection took place in June 2016, and endline data collection will begin in September 2016. These assessments measure reading gains at the midpoint and at the end of Grade 2 and will indicate whether the gains made at the midpoint persist to the endline.

The assessment was designed to sample Grade 2 students in 30 schools. The District office of the Ministry of Education provided a list of 135 schools in the Katete district, and the following selection criteria were applied to create the sample frame:

1. Schools offered reading instruction in ciNyanja for first and second grade students.
2. Schools did not participate in 2014 national EGRA.
3. Schools did not participate in the previous GG study (Ojanen, 2015) in the Eastern province in 2014.
4. Schools had cellular coverage by Airtel.

Out of 135, 38 schools remained eligible for selection, and 30 primary schools were selected to participate in the baseline assessment.

Instrument Development

ACR GCD has two grantees in Zambia, both of which are using the existing ciNyanja EGRA that was developed and adapted by Research Triangle Institute International (RTI) in 2014. This allows for comparability across both ACR GCD projects. In addition to the EGRA, additional assessments/surveys were included in the baseline exercise:

1. A *demographic questionnaire* for students about their language background and home environment. This questionnaire was incorporated into Tangerine, an open source software used to administer EGRA on tablets, and conducted in conjunction with EGRA.
2. *GG ciNyanja letter-sound and word recognition assessment*. The GG assessment was conducted on mobile devices following the EGRA.
3. Two *teacher questionnaires* about teacher familiarity with information and communications technology (ICT) and knowledge of language and literacy instruction.

Demographic Questionnaire. The demographic questionnaire was used to collect background information about the students. The questions included information related to the students' social economic status, ICT use in the home and the home learning environment. The purpose of the questions was to get a better understanding of the sample and the background of the students.

This information will be used to better understand EGRA results and factors that may affect a student's literacy skills.

GG ciNyanja Letter-sound and Word Recognition assessments. GG's built-in assessment tools track data over the course of the game. GG begins with Letter-sound and Word Recognition assessments, then adapts to players' answers and modifies the learning content based on the player's performance. Unlike the EGRA, the assessments do not require the child to verbally state the response. Instead, children point to the response based on auditory and visual stimuli presented on their mobile phone.

The GG assessments were conducted in tandem with the EGRA for two reasons. First, it allowed the research assistants, who are experts in the game, to introduce the game to the children, thus minimizing errors as all children were introduced to the game in the same way and played the same game levels at the beginning of the intervention. If the teachers started the game intervention with the players before the baseline, the quality of the first GG assessment would be compromised.

The second reason for using the GG assessments was to collect additional data on two foundational literacy skills tracked through the EGRA: letter-sound and word recognition skills. **The children in this project were selected because they were performing at or below minimum government standards (Red Level) at the end of Grade 1.** Measuring literacy skills can be challenging if the children are only in the beginning stages of learning to read and have not yet automatized their skills. EGRA requires children to speak in the presence of an unfamiliar adult, which can be challenging in this cultural context. It also requires students to retrieve something from memory without prompting. This may be more demanding than recognizing written items among a series of options after an auditory cue, which is how GG assessments are conducted. Conducting the two types of assessments in tandem allows for a comparison between how the two skills are tested – either through verbal responses or through identifying the correct answer on a mobile phone.

The GG Letter-sound assessment is divided into three parts with a small pause between each part. In each part, eight phoneme sounds are presented, one at a time, and all 24 letters of the ciNyanja alphabet are visible on the screen. The player must find the letter that corresponds to the sound they hear and select that letter by touching the letter on the screen.

The GG Word Recognition assessment first asks students to identify eight syllables, constructed using a consonant-vowel (CV) pattern. For each item, the game presents six options on the screen, and the player must identify the corresponding syllable among them. If the player passes the syllables section, the game advances so students are also asked to identify words of varying length (between four and seven letters).

Teacher Questionnaires. Teachers responded to two questionnaires. The purpose of administering the questionnaires was to understand the teachers' knowledge and attitudes about teaching mother tongue literacy and their use of ICT. The first questionnaire collected information about

the teachers' educational background, the teaching methods and reading instruction in their schools, and their views about literacy instruction and struggling readers. The second questionnaire centered on the type of ICT the teachers had exposure to, ICT training, their amount of internet exposure and their interaction with social media and ICT infrastructure in schools.

Sample

The sample was comprised of 575 Grade 2 students and their teachers in government schools in the Katete district of the Eastern province of Zambia.

Table 2: Total Number of Students Assessed by Group and Gender

Group	Boys	Girls	Total
Treatment	112	183	295
Control	123	157	280
Total	235	340	575

The research team randomized at the school level. Schools were randomly assigned into treatment and control schools. Fifteen schools were assigned to the treatment group and fifteen were assigned to the control group. In each school, Grade 2 classes were randomly selected depending on the number of Grade 2 classes in the school, and, in total, 37 Grade 2 teachers were included in the sample. The number of Grade 2 students selected into the project treatment or control groups was calculated using proportional sampling, and Table 2 shows the total number of students in treatment and control groups by gender.⁹

V. Fieldwork Preparation and Data Collection

Assessor Training

A total of 12 assessors were selected by CAPOLSA to conduct the baseline assessment. All had data collection experience, and some had previous experience administering GG under CAPOLSA or conducting an EGRA with other organizations. Each assessor underwent extensive interviews and background checks prior to being hired.

A GG training was held from January 14-15, 2016. An expert from the Agora Center conducted the training with assistance from the assessors that had previously worked with GG at CAPOLSA. The main goal of the training was to ensure that the assessors were able to conduct the GG assessments in less than 10 minutes so that the total assessment time for both EGRA and GG subtasks would be 30 minutes per child. During the training, each assessor received a unique GG user name so their practice could be observed to ensure they understood the game. Further, assessors also used the GG phones outside of the training session to familiarize themselves with the game. All feedback provided by assessors was incorporated into the instructions for GG

⁹ The sample size in Table 2 applies to EGRA subtasks. The total number of students in the baseline sample for the GG Letter-sound and Word Recognition assessments is 567.

baseline assessments. This training session served as the model for the GG teacher training session in the GG-TTS project.

The EGRA assessor training took place from January 18-22, 2016 (see Appendix A for the EGRA Adaptation Workshop Agenda).

Inter-rater Reliability (IRR) Test

Inter-rater reliability is a measure of reliability used to assess the degree to which different assessors agree in their assessment decisions. Inter-rater reliability tests ensure that the different assessors interpret answers in the same way. Assessors may disagree within an acceptable level (10 percent), and it will have minimal effect on the EGRA score for each student. IRR tests for the GG-TTS were done prior to the baseline data collection. With the exception of one, the assessors met the 90 percent threshold for IRR on the EGRA assessment. The one assessor who scored below the threshold at 85 percent was required to continue to practice and was recommended to conduct the assessment, as he had strong performance and built rapport with students during the pilot tests.

Institutional Review Board (IRB) for Human Participants¹⁰

The Institutional Review Board (IRB) is responsible for ascertaining the acceptability of proposed research in terms of institutional commitments and regulations, applicable laws, standards of professional conduct and practice, and ethical and societal norms. The IRB examines subject recruitment procedures, proposed remuneration, and the informed consent process. The IRB also evaluates the potential risks and benefits to participants outlined in each protocol.

The application to conduct this study was submitted to the University of Zambia, School of Humanities and Social Sciences Research Ethics Committee (UNZAREC). The Committee reviewed the application at the end of 2015 and gave official approval in writing in February 2016 for a duration of one year.

Data Analysis

Before data analysis began, the EGRA sample was matched with the GG sample to ensure student data was available for both assessments. Records in the EGRA dataset – including the student’s demographic information – were matched with the anonymous GG game log data using the school code and individual GG ID code. Originally, the EGRA dataset had more records than the GG dataset, which was due to the fact that some students started the EGRA, but did not complete it and, as a result, did not continue to the GG assessments. Over 97 percent of the students were assessed according to the GG baseline assessment protocol. Variations from protocol occurred when students were allowed to play a different reward game, though these student records were not excluded from the sample because the GG assessments were correctly conducted. The final

¹⁰ Following The Protection of Human Subjects in Research Supported by USAID, all ACR GCD projects sought human subjects’ approval through a local Institutional Review Board (IRB) to ensure there was minimal risk to the students participating in the interventions and associated assessments.

dataset includes 575 students with EGRA assessments, and, of these, only eight students are missing GG data due to the inability to conclusively match the GG ID code with the EGRA data. Data were analyzed using STATA and Excel, which resulted in graphs and frequency tables. Differences between treatment and control groups were tested for significance, and where found, these differences are noted in the results (see Section VII and Annex B). Mean scores on each subtask were compared using ANOVA and differences in the proportion of zero scores (students who scored zero on a subtask) were compared using the chi-square test for significance.¹¹

Furthermore, for each subtask, decision rules were applied to exclude outliers. For example, if the time remaining for a timed subtask resulted in a fluency rate that was outside a reasonable range, then that student’s fluency rate was not included in the analyses. Reasonable ranges for time remaining were based on multiple factors, including the rate at which letters or words in the language tested are typically read and the mean fluency rate with and without the outlier data point(s).

Table 3: Subtask and Data Analysis Methods

Subtask	Type	Analysis
Orientation to Print	Untimed	Orientation to Print is measured as the number of questions a student can correctly answer regarding text direction, the concept of a word, or basic knowledge of printed material. There are three questions in this subtask.
Letter-sound Knowledge	Timed	Letter-sound Knowledge is measured as correct letter-sounds read in one minute (CLSPM). Letter-sound Knowledge is a measure of alphabet knowledge. Each student had the opportunity to read up to 100 upper and lower case letters.
Nonword Reading	Timed	Nonword Reading is measured as correct “nonwords” read in one minute. Nonword Reading measures decoding (CNWPM). Each student had the opportunity to read up to 50 one and two syllable “nonwords”.
Oral Reading Fluency (ORF)	Timed	ORF is measured as correct words read in one minute. ORF is a decoding and reading fluency measure. Each student had the opportunity to read 40 words. The ORF passage formed the textual basis for the Reading Comprehension subtask.
Reading Comprehension	Untimed	Reading Comprehension is measured as the number of correct answers verbally delivered to the assessor based on questions asked about the passage read as part of the ORF subtask. Each student had the opportunity to answer five factual questions.
Listening Comprehension	Untimed	Listening Comprehension is measured as the number of correct answers verbally delivered to the assessor. Listening Comprehension is a measure of vocabulary. Each student had the opportunity to answer five questions based on a passage read to them by the assessor.

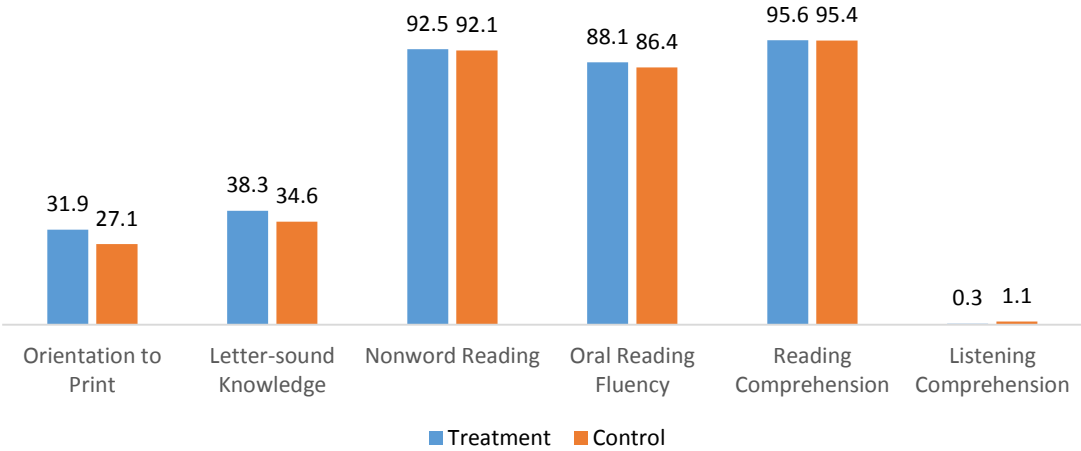

¹¹ ANOVA stands for Analysis of Variance. It is a statistical model that is used to analyze the differences between group means, which helps identify differences in the sample that can be generalized to the population. The chi-square test is a statistical test comparing proportions of zero-score students that were observed in the data against what was expected.

GG Letter-sound	Untimed	The GG Letter-sound assessment is measured as number of correctly identified letter-sounds on a mobile phone screen after hearing the phoneme sound in headphones. The maximum score is 24.
GG Word Recognition	Untimed	The GG Word Recognition assessment is measured as the number of correctly identified syllables and words on a mobile phone screen after hearing the syllable or word in headphones. The maximum score is 24.

VI. Summary of Findings

Overall, the results suggest that the target population lacks the foundational skills necessary to read with fluency and comprehension as measured by the EGRA. Out of a total of 295 students in the treatment group and 280 in the control group, the lowest proportion of zero scores was on the Listening Comprehension subtask, on which one student in the treatment group and three students in the control group were not able to answer any questions. Students had the highest proportion of zero scores on the Reading Comprehension subtask – 282 in the treatment group and 267 in the control group¹².

Figure 1: Percent of Zero Scores by Treatment Group

VII. Results by Group and Gender

This section reports the results from the baseline assessment by EGRA subtask, group type, and gender. Each subsection contains a description of the subtask followed by the mean score (untimed subtasks) or mean fluency rate (timed subtasks), standard deviation (SD)¹³, and number of zero scores. Results are reported for treatment and control groups, as well as for boys and girls.

¹² As noted in the Instrument Development section, the children in this project were selected because they were performing at or below minimum government standards (RED Level) at the end of Grade 1.

¹³ The standard deviation (SD) of the measure of interest – here, mean fluency rates – describes the spread between scores. Smaller SD values indicate that the majority of values lie close to the mean; larger SD values indicate that mean fluency rates varied and were more spread out.

Results for GG assessments are also presented below (for additional results by subtask, see Annex B).

Orientation to Print

Orientation to Print measures students’ knowledge of how words are organized on a page, the direction of print (e.g., left to right), and how print materials are organized. In this subtask, students are given a text and asked to answer a series of questions demonstrating their understanding of how words on a page are organized and read. Students indicated their response to the three questions asked by pointing to the correct part of the page or by indicating the correct direction of reading.

Results for the Orientation to Print subtask are detailed in Table 4. Students in the treatment and control groups performed similarly on this subtask. **On average, students responded correctly to 50 percent of the subtask questions, and, overall, nearly one third of students were unable to answer a single question.** There were no statistically significant differences between boys and girls, nor were there any statistically significant differences between the treatment and control groups.

Table 4: Orientation to Print Score by Treatment Group and Gender

Group	Gender	N	Mean Score (Number of Questions Correct)	SD	Zero Scores (n)
Treatment	Boys	112	1.5	1.2	31
	Girls	183	1.4	1.2	63
	Total	295	1.4	1.2	94
Control	Boys	123	1.6	1.2	31
	Girls	157	1.5	1.2	45
	Total	280	1.5	1.2	76
Total: All Students		575	1.5	1.2	170

Letter-sound Knowledge

The Letter-sound Knowledge subtask measures students’ understanding of the “alphabetic principle” which states that each letter of the alphabet corresponds to a specific sound. To demonstrate Letter-sound Knowledge, students must identify the appropriate sounds for each letter symbol. The ability to match letters with correct sounds is critical to reading fluency and comprehension. For this subtask, each student was presented with a stimulus of 100 letters and asked to read as many of the sounds as they could in one minute.¹⁴

¹⁴ There is an auto stop rule in all the timed EGRA subtasks. In this case the test was discontinued if a student was unable to correctly name any the first 10 letters on the stimulus.

The mean fluency rates (correct letter-sounds per minute, or CLSPM) for this subtask are presented in Table 5. **On average, students identified 3.6 letter-sounds within one minute**, and the difference in mean fluencies were not statistically significant for treatment and control groups, nor for boys and girls.

Table 5: Letter-sound Knowledge Fluency by Treatment Group and Gender

Group	Gender	N	Mean Fluency (CLSPM)	SD	Zero Scores (n)
Treatment	Boys	112	3.2	4.2	44
	Girls	183	3.9	4.5	69
	Total	295	3.6	4.4	113
Control	Boys	123	4.0	4.1	38
	Girls	157	3.5	4.3	59
	Total	280	3.7	4.2	97
Total: All Students		575	3.6	4.3	210

Overall, about 37 percent of students were unable to identify a single letter-sound. Treatment group students had a slightly higher proportion of student who received a zero score on the subtask than control group students – 38 percent versus 35 percent, respectively.

Nonword Reading

The Nonword Reading subtask is a measure of decoding ability and is designed to present children with words that they would not be able to recognize by sight through familiarity. Many children in the early grades learn to memorize or recognize a range of familiar words by sight alone. Thus, to assess children’s decoding skills, they are presented with invented (nonsense) words, which require them to sound out each letter and syllable to decode a word. During this timed subtask, the assessor presented each child with 50 nonwords and asked them to read as many as possible in one minute.¹⁵

Overall, the mean fluency rates (correct nonwords per minute, or CNWPM) for the Nonword Reading subtask were low for students in both treatment and control groups (see Table 6). In treatment and control schools, children could decode an average of 0.3 CNWPM. When results were compared by gender, the difference between boys’ and girls’ performance was not statistically significant.

¹⁵ After one minute, the student was asked to stop. The subtask was discontinued if a student was unable to correctly read any the first 10 nonwords.

Table 6: Nonword Reading Fluency by Treatment Group and Gender

Group	Gender	N	Mean Fluency (CNWPM)	SD	Zero Scores (n)
Treatment	Boys	112	0.4	2.0	105
	Girls	183	0.2	0.9	168
	Total	295	0.3	1.4	273
Control	Boys	123	0.4	1.7	112
	Girls	157	0.4	2.3	146
	Total	280	0.4	2.0	258
Total: All Students		575	0.3	1.8	531

Students receiving zero scores on Nonword Reading were high in comparison with other subtasks. **Overall, 92 percent of students in control schools and 93 percent of students in treatment schools were not able to decode a single nonword correctly.**

Oral Reading Fluency (ORF)

Oral Reading Fluency (ORF) is a measure of overall reading competence. It is the culmination of translating letters into sounds, merging sounds to become words, linking words to become sentences, relating text to meaning, and making inferences to fill in missing information.¹⁶ A student's ORF score is dependent on the skills in previous subtasks, since children need to have some mastery of orientation to print, letter-sounds, and decoding of nonwords to read fluently.

In this timed EGRA subtask, assessors asked students to read a 40-word ciNyanja passage aloud for one minute. As shown in Table 7, **over 87 percent of students were unable to read any words in the passage.** On average, students in both treatment and control schools were able to read 0.5 CWPM. The difference between boys' and girls' fluency was not statistically significant in neither treatment nor control groups.

Table 7: Oral Reading Fluency (ORF) by Treatment Group and Gender

Group	Gender	N	Mean Fluency (CWPM)	SD	Zero Scores (n)
Treatment	Boys	112	0.6	3.0	104
	Girls	183	0.4	1.3	156
	Total	295	0.4	2.1	260
Control	Boys	123	0.6	2.1	105
	Girls	157	0.7	3.4	137

Reading Comprehension

The Reading Comprehension subtask indicates how well students understood the ciNyanja passage that they read in the ORF subtask. Upon completion of the ORF subtask, assessors read aloud up to five comprehension questions based on the text and asked students to respond verbally. The number of questions asked by assessors was contingent on the amount of text the students read in the ORF subtask.¹⁷ As a result, the zero scores shown in Table 8 reflect two types of students: (1) those who did not read enough of the passage to be asked a single question, and (2) those who read enough to be asked at least one comprehension question, but answered all questions incorrectly.

Table 8: Reading Comprehension Score by Treatment Group and Gender

Group	Gender	N	Mean Score (Number of Questions Correct)	SD	Zero Scores (n)
Treatment	Boys	112	0.0	0.3	108
	Girls	183	0.1	0.2	174
	Total	295	0.1	0.2	282
Control	Boys	123	0.1	0.3	117
	Girls	157	0.1	0.4	150
	Total	280	0.1	0.3	267
Total: All Students		575	0.1	0.3	549

Given the high proportion of zero scores on the ORF subtask, the proportion of zero scores on the Reading Comprehension subtask was also high – **approximately 95 percent of students were unable to answer a single question correctly**. On average, students were able to correctly answer 0.1 questions.

To further understand the high number of students receiving zero scores and low mean scores on the Reading Comprehension subtask, Table 9 shows the mean number of questions attempted by students. The maximum number of questions attempted by any student was four out of a potential five, indicating that no child was able to read enough text on the ORF subtask to attempt the maximum number of reading comprehension questions. On average, students attempted only 0.2 questions.

¹⁷ For example, if a student read the first sentence of text (5 words), s/he would be asked the first comprehension question. Similarly, if a student read the whole text (40 words), s/he would be asked all five questions.

Table 9: Reading Comprehension Questions Attempted by Treatment Group and Gender

Group	Gender	N	Mean (Number of Questions Attempted)	SD	Range
Treatment	Boys	112	0.2	0.5	0-2
	Girls	183	0.2	0.5	0-2
	Total	295	0.2	0.5	0-2
Control	Boys	123	0.2	0.5	0-2
	Girls	157	0.2	0.6	0-4
	Total	280	0.2	0.6	0-4
Total: All Students		575	0.2	0.5	0-4

Listening Comprehension

The Listening Comprehension subtask is an untimed assessment of children’s abilities to comprehend the meaning of a story read to them orally. Students do not need to know how to read to answer Listening Comprehension questions, and, as a result, this subtask is an important measure of students’ pre-reading abilities because it helps detect obstacles to learning to read such as limited language proficiency, auditory problems, attention deficit and other difficulties. In this subtask, the assessor read a short passage to the student and asked them to answer five comprehension questions¹⁸ about what they heard.

Table 10 presents the mean number of questions answered correctly by students. **Students in both the treatment and control groups performed similarly, answering nearly three out of five Listening Comprehension questions correctly.** Zero scores were much lower than for previous subtasks, with less than one percent of students unable to answer a single listening comprehension question correctly.

Table 10: Listening Comprehension Score by Treatment Group and Gender

Group	Gender	N	Mean Score (Number of Questions Correct)	SD	Zero Scores (n)
Treatment	Boys	112	2.9	1.1	0
	Girls	183	2.9	1.1	1
	Total	295	2.9	1.1	1
Control	Boys	123	2.7	1.0	1
	Girls	157	2.7	1.1	2

¹⁸ The first three were direct questions (answers found explicitly in the story). The fourth and fifth questions were inferential.

Total	280	2.7	1.1	3
Total: All Students	575	2.8	1.1	4

The specific number of Listening Comprehension questions that students answered correctly is shown in Table 11. In the treatment group, nearly six percent of students were able to correctly answer five questions, whereas just over three percent of students in the control group were able to correctly answer five questions. **The majority of students in both the treatment and control groups were able to answer three questions correctly.**

Table 11: Listening Comprehension Questions Correct by Treatment Group and Gender

Group	Number of Questions Correct	Girls		Boys		N Total	% Total
		N	%	N	%		
Treatment	0	1	0.6	0	0	1	0.3
	1	21	11.5	13	11.6	34	11.5
	2	48	26.2	28	25	76	25.8
	3	54	29.5	40	35.7	94	31.9
	4	48	26.2	25	22.3	73	24.8

	4	37	23.6	26	21.1	63	22.5
	5	5	3.2	4	3.3	9	3.2
	Total	157	100	123	100	280	100

GG Letter-sound

On the GG Letter-sound assessment, 24 letters appear on a screen and the sounds are heard on headphones one-by-one. The assessment is presented as three sets of stimuli, always shown in the same order:

Set 1: o n s u t m l k

Set 2: a r p i b g d c

Set 3: e f y z j v h w

On the GG Letter-sound assessment, **the mean number of letter-sounds identified correctly was less than four out of a maximum possible score of 24.** On average, children identified 3.7 letter-sounds correctly compared with an average fluency rate of 3.6 on the EGRA Letter-sound Knowledge subtask, although comparative analyses have not yet been conducted to determine correlations between the two assessments. On the GG Letter-sound assessment, approximately 10 percent were not able to identify any of the letters correctly. This is significantly less than the proportion of zero scores on the EGRA Letter-sound Knowledge subtask – approximately 37 percent – which may indicate that selecting the letters on the mobile phone is easier for the

children. Again, without a more comprehensive comparative analysis, it is not possible to conclusively determine the relationship between scores on the two assessments.

Table 12: GG Letter-sound Score by Treatment Group and Gender

Group	Gender	N	Mean Score (Number of Letter-sounds Correct)	SD	Zero Scores (n)
Treatment	Boys	108	3.5	2.6	9
	Girls	182	3.9	3.0	19
	Total	290	3.7	2.8	28
Control	Boys	122	3.6	3.1	10
	Girls	155	3.7	3.4	18
	Total	277	3.6	3.3	28
Total: All Students		567	3.7	3.0	56

GG Word Recognition

On the GG Word Recognition assessment, the first eight items presented are two-letter syllables in a consonant-vowel pattern – bu, ka, li, se, yo, co, me and gi. If children make three mistakes within the first eight items, the assessment ends, and, as a result, if children receive a score of less than five, they were not presented with any words.

Table 13: GG Word Recognition Score by Treatment Group and Gender

Group	Gender	N	Mean Items Identified	SD	Zero Scores (n)
Treatment	Boys	108	2.2	3.0	21
	Girls	182	2.0	2.7	34
	Total	290	2.1	2.8	55
Control	Boys	122	2.4	3.0	19
	Girls	155	2.4	3.5	27
	Total	277	2.4	3.3	46
Total: All Students		567	2.3	3.0	101

Results in Table 13 indicate that zero scores were comparable for treatment and control groups (19 percent and 17 percent, respectively). **On average, students identified less than three items correctly out of a possible 24 items, meaning that many students did not score high enough to continue with the GG Word Recognition assessment beyond the syllables section.**

VIII. Contextual Factors

The schools in the project were visited by a CAPOLSA representative to provide information about the project. CAPOLSA requested that Head Teachers provide a list of Grade 1 Red Level children from the 2015 school year. The schools were visited and dates for the baseline assessment were set.

The baseline assessment was completed over the course of 10 days in Katete. The research assistant team was divided to three sub-teams. Each team was supervised by a team leader. Typically, each team assessed one or two schools in a day. When necessary, the teams combined their forces and worked together in a school that had a large number of students. There were various challenges encountered during the assessment process. In some schools, assessments had to be conducted outside, underneath trees because space was unavailable in the classroom buildings. In some schools, this was distracting for the both assessors and the learners because of the surrounding noise. This was especially challenging on days when it rained because assessments would be conducted in corridors. However, in some schools, indoor space was allocated to the research team for assessments.

Teacher Questionnaires

Two teacher questionnaires were administered to teachers in the sample to provide contextual details. Results in Table 14 show the average age of teachers by treatment group and by gender. This information is useful, as it provides an indication of when teachers received their primary school education. In this project, most teachers were in primary school during the late 1980's and early 1990's, which means they themselves learned to read during the language policy and curriculum which was in effect during that time. The average age for teachers across treatment groups and genders is about 35 years.

Table 14: Teachers' Age by Treatment Group and Gender

Group	Gender	N	Mean Age	SD
Treatment	Male	8	32.1	5.5
	Female	10	35.7	9.6
	Total	18	33.9	7.6
Control	Male	8	37.3	11.6
	Female	11	33.9	6.5
	Total	19	35.6	9.1
Total: All Teachers		37	34.7	8.3

The teachers' educational background and qualifications differ minimally between treatment and control groups, as evidenced in Figure 2. Of treatment group teachers, 39 percent have a primary diploma, 22 percent have a primary teacher's certificate, and 17 percent have both. In the treatment group, 47 percent have a primary teacher's certificate, 32 percent have a primary diploma, and 16 percent have both. No teachers in the control group have a BA in education, while 5 percent in the treatment group do.

Figure 2: Educational Background of Teachers by Treatment Group

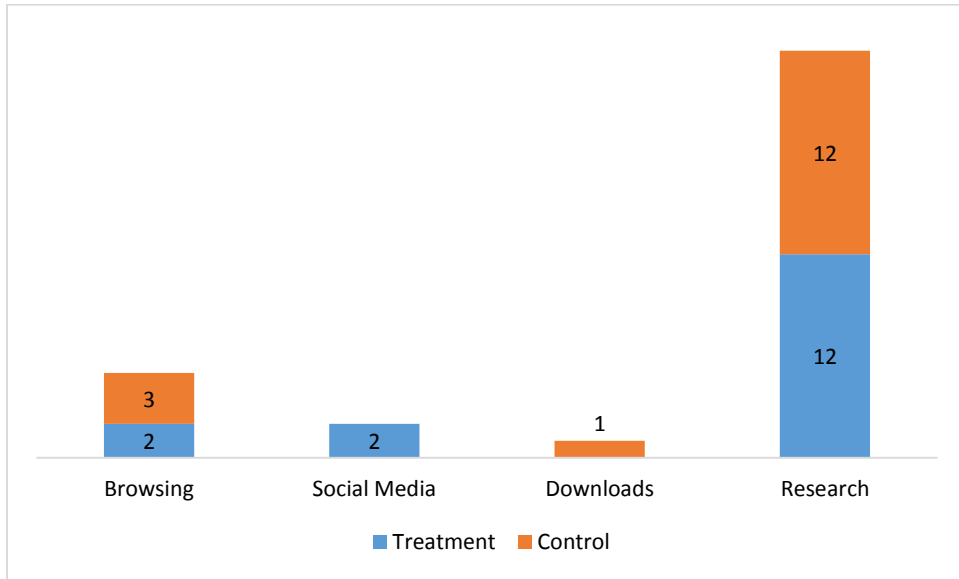

As seen in Figure 3 below, for both treatment and control groups, the majority of teachers have analog phones – 67 percent in the treatment group and 56 percent in the control group. Because GG is administered on smart phones, even though smart phones were provided for the project, this may have implications on teachers’ ability to utilize the game.

Figure 3: Mobile Phone Ownership by Treatment Group

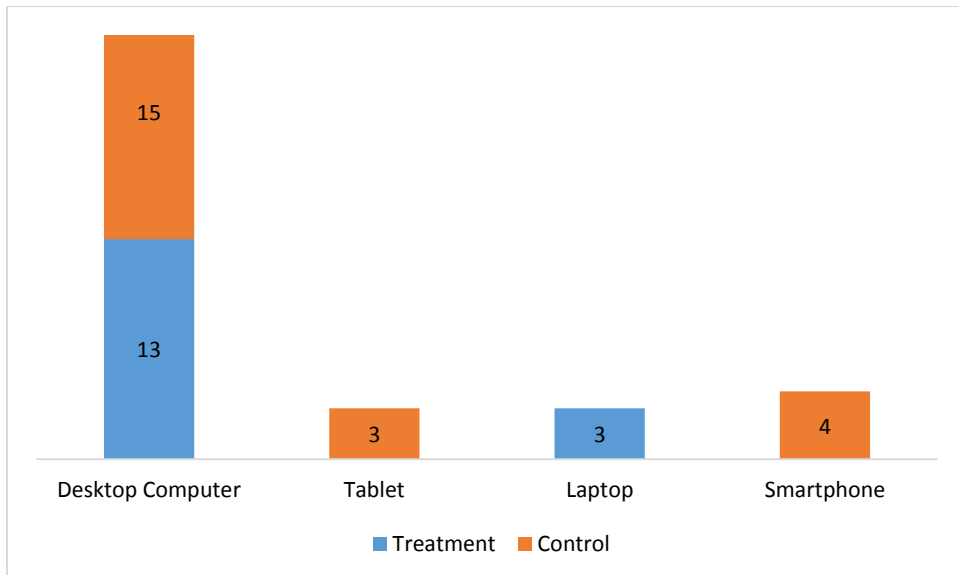

Teachers were also asked about their use of internet at baseline, as one of the components of the GG-TTS requires teachers to access online materials. Results are presented in Figure 4. A majority of the teachers reported using internet before, and equal numbers of teachers from the treatment and control groups reported using the internet for research purposes, which is the highest usage category reported. Five teachers said they use the internet for browsing, two for social media, and one for downloads.

Figure 4: Internet Use by Treatment Group

In addition to internet usage, teachers responded to questions about the type of ICT equipment they utilize in their schools. The majority of teachers who report using ICT equipment in schools use desktop computers, followed by smartphones, tablets and laptops (see Figure 5). It should be noted that seven teachers – two in the treatment group and five in the control group – reported that they did not use any type of ICT equipment in their school.

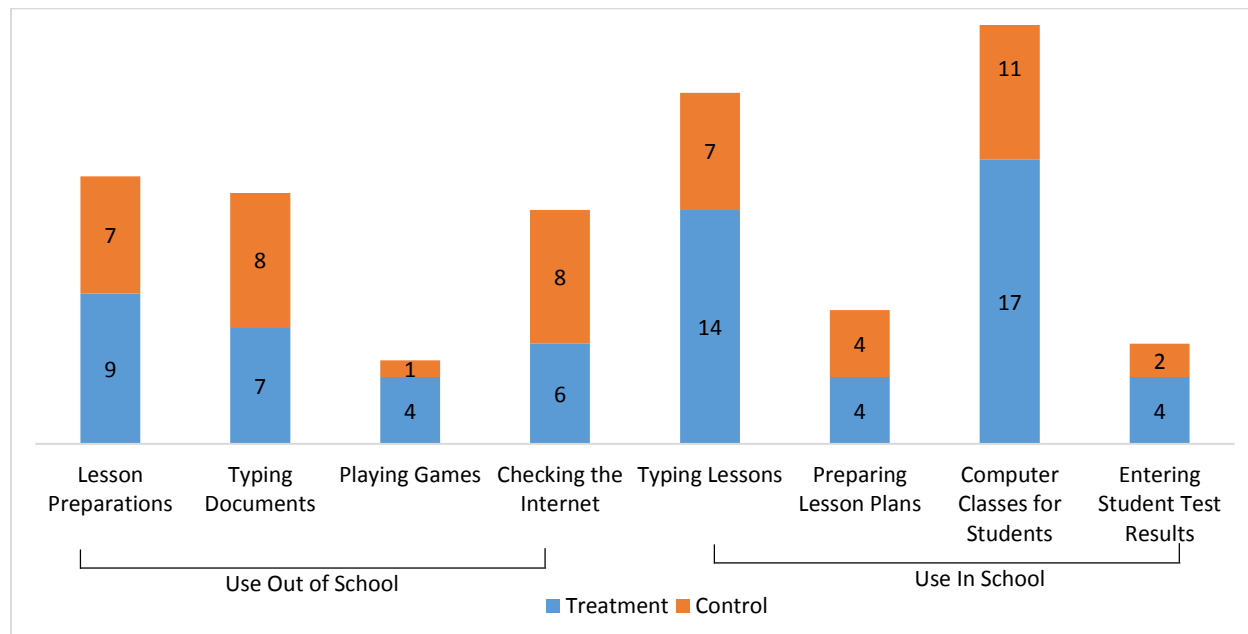

Figure 5: ICT Equipment Use in Schools by Treatment Group

Results in Figure 6 show teachers' purpose for using ICT equipment both in school and out of school. Overall, teachers use ICT equipment most often to provide computer classes for their students, followed by typing lesson plans. The most frequent reasons for ICT equipment use

outside of their schools is for lesson preparations and for typing documents. Teachers use ICT equipment least often for playing games.

Figure 6: ICT Equipment Purpose by Treatment Group

IX. Conclusions and Recommendations

The results presented in this baseline report suggest that the target population lacks the foundational skills necessary to read with fluency and comprehension. The following recommendations build on that knowledge by focusing on the key next steps to improving children’s understanding of how print works as well as their letter-sound identification and decoding skills, which are needed to improve rates of fluency and comprehension.

1. **Reinforce foundational reading skills.** Work with schools and families to focus on the mechanics of reading to reinforce student knowledge of how to hold a book, which word to read first, etc. (orientation to print). Build on that with an emphasis on the basic components of reading: letter-sounds, decoding, and reading comprehension.
2. **Provide ongoing teacher training on literacy support for early grades.** Reading with fluency and comprehension is the culmination of mastering many foundational skills, which students are introduced to from the early grades. By training teachers to teach these initial skills, including orientation to print, letter-sounds, and decoding, and then transitioning into reading and listening comprehension, early grade students can build the core understanding needed to read fluently.
3. **Provide additional ICT training for teachers.** Training could help fill the gap in knowledge that teachers may be experiencing with regards to using ICT. However, more information on the specific training needs is needed. For example, specific information on their level of knowledge in the use of applications such Microsoft Word or how to search

for information on the internet should be collected. Teachers in the study indicated that they used the internet for browsing and searching for information. It will be important to know what kind of information they search for and how exactly they browse, for example what search engines they use. This will provide a more accurate understanding of the kind and extent of ICT knowledge the teachers possess. Only then can an effective, needs based, ICT training program be designed.

Verbal Consent

It is important to establish a playful and relaxed rapport with the child. The child should perceive the assessment almost as a game to be enjoyed rather than a severe situation. It is important to read the directions slowly and clearly. After you have finished, thank the child for their time and effort.

Uli bwanji. Dzina langa ndine..... ndipo ndikhala ku..... Ndingakonde kukuza za moyo wanga. Good morning. My name is ____ and I live in _____. I'd like to tell you a little bit about myself.

[Number and ages of children; favourite sport, radio or television program, etc.]

1. Kodi umakonda kucita ciani ngati siuli mu sukulu? What do you like to do when you are not in school?

[Wait for response; if pupil is reluctant, ask question 2, but if they seem comfortable continue to verbal consent].

2. Kodi ndi masewera otani amene umakonda kusewera? What games do you like to play?

(READ THE FOLLOWING WORD-FOR-WORD)

Ndifuna kukuza cifukwa cake ndabwera kuno lero. Ndigwira nchito pa sukulu yama phunziro apamwamba ya mu Zambia (University of Zambia). Ndipo tikufuna kumvetsetsa mmene ana amaphunzirira kuwerenga. Iwe wasankhidwa mwamwai. Let me tell you why I am here today. I work with the University of Zambia and we are trying to understand how children learn to read. You were picked by chance.

Ndifuna thandizo lako pa nkhanayi. Koma suyenera kutengako mbali ngati sufuna. We would like your help in this. But you do not have to take part if you do not want to.

Ife tizachita sewero la kuwerenga. Ine ndizakufunsa kuwerenga malembo, mau ndi ka nthano kakafupi mokweza mau. Ndizakufunsanso kuzindikira ndi kuyankha mafunso ocepta. We are going to play a reading game. I am going to ask you to read letters, words and a short story out loud.

Mwakugwiritsa nchito lamya iyi , ndizaiemba mayakho ako . I am going to use this "phone" to record your answers. **Zimene tizachita pano si mayeso ndipo sizidzakhudza maphunzilo ako pasukulu lino.** This is NOT a test and it will not affect your grade at school.

Ndizakufunsanso mafunso ena monga kumene umayeselera kuwerenga ndiponso ngati ukonda kuwerenga. I will also ask you other questions about where you practice reading and whether you like it.

Kaciwirinso, sungatengeko mbali ngati sufuna kutero. Tikayamba kufunsa mafunso, ngati siufuna kuyankha funso ungakhale cete, zilibwino cabe. Once again, you do not have to participate if you do not wish to. Once we begin, if you would rather not answer a question, that's all right.

Kodi uli ndi mafunso alionse? Do you have any questions?

Kodi uvomela kutengako mbali musewero iyi? Would you like to participate?

Kodi wakonzeka kuti tiyambe? Are you ready to get started?

(If verbal consent is not given, thank the child and move on to the next child.)

Check box if verbal consent is given:

Orientation to Print

Show the child a story passage in the pupil stimuli packet. Read the instructions in the gray boxes below, provide the child 10 seconds to respond, recording the child's response before moving to the next instruction. If the child doesn't respond in the 10 seconds, mark as no response and move on.

Sindifuna kuti uwerenge tsopano. Pa pepala iri, ungayambire kuti kuwerenga? Ndionetse ndi cala cako.

[I don't want you to read this now. On this page, where would you begin to read? Show me with your finger.]

[[Child puts finger on the top row, left-most word]]

Correct Incorrect No response

Tsopano ndionetse mbali imene udzawerenga motsatira.

[Now show me in which direction you would read next.]

[[Child moves finger from left to right.]]

Correct Incorrect No response

Ukafika kotsirizira kwa mzere, udzawerenga kuti motsatira?

[When you get to the end of the line, where would you read next?]

[[Child moves finger to left-most word of second line]]

Correct Incorrect No response

Letter Sound Knowledge

Pano ndili ndi tsamba limene liri ndi malembo a alifabeti ya muchinyanja. Coonde ndiuze MAMVEKERO a malembo a alifabeti amene ungate kuwerenga. Usanene maina ake. Koma mvekero zake. Here is a page full of letters of the Chinyanja alphabet. Please tell me the SOUNDS of as many letters of the alphabet as you can. Not their names, but their sounds.

[point to the letter A] **Mwacitsanzo, mvekero la lembo ili ndi /a/.** For example, the sound of this letter is /a/.

[point to the letter p] **Tiye tiyese: ndiuze mvekero la lembo ili:** Let's practice: Tell me the sound of this letter.

Correct: Cabwino, mvekero la lembo ili ndi /p/ Good, the sound of this letter is /p/.

Incorrect: Mvekero la lembo ili ndi /p/ The sound of this letter is /p/.

[point to the letter L] **Tsopano tiye tiyese lembo lina. Ndiuze mvekero la lembo ili.** Now let us try another one. Tell me the sound of this letter.

Correct: Cabwino, mvekero la lembo ili ndi //. Good, the sound of this letter is //.

Incorrect: Mvekero la lembo ili ndi //. The sound of this letter is //.

[point to first letter] **Ndikanena kuti "yamba", uyambire apa ndi kupitiriza mopingasa tsamba ili. Lata pa lembo lirilonse ndipo ndiuze mvekero la lembo limenelo mmau okweza. Reading Comprehension

Tsopano ndidzakufunsa mafunso ocepa onena za nthano imene wawerenga. Yesa kuyankha mafunso mmene ungakwanisire. Now I am going to ask you a few questions about the story you just read. Try to answer the questions as well as you can.

1. Ndani anapita kumsika? ((Amai))

Correct Incorrect No response

2. Mwana anatsala ndi ndani? ((Dolika, kapena azake a Dolika, Dolika ndi Azake))

Correct Incorrect No response

3. Kodi mwana anaphunzitsiwa kucita ciani? ((Kuyimba, Kuyimba nyimbo ya alifabeti))

Correct Incorrect No response

4. Kodi mwana anadziwa bwanji kuyimba nyimbo ya alifabeti? ((Dolika ndi anzake anamphunzitsa,anzake a Dolika anamuphuzitsa, Dolika anamuphuzitsa))

Correct Incorrect No response

5. N'cifukwa ciani amai anakondwera? ((Mwana anali kuyimba))

Correct Incorrect No response

Listening Comprehension

Do not allow the child to look at the passage or the questions. Say,

Ndidzakwerengera ka nthano/nkhani mokweza KAMODZI ndipo pambuyo pake ndidzakufunsa mafunso. Conde umvetsere mosamalira ndipo uyankhe mafunso mmene ungakwanitsire. Wakonzeka? Tiye Tiyambe.

Patsiku Lolemba, Mangani anapita kusukulu.

Ananyamula mabuku ndi nyama m'chola cake.

Pamene anali kuyenda, anapeza galu wamkulu panjira.

Anafuna kuthawira pathengo koma anagwa pansi.

Yunifomu yake inada ndipo galu anatenga nyama yake.

Mangani anathawira kunyumba.

Pamene anafika kunyumba, m'bale wake anamubwereka yunifomu yake. Anakondwera.

1. Ndi tsiku liti pamene Mangani anapita kusukulu? (Pa Lolemba)

Correct Incorrect No response

2. Ananyamula ciani mu chola cake? (Mabuku, Nyama, Mabuku ndi nyama)

Correct Incorrect No response

3. N'ciani cimene anapeza panjira? (Anapeza galu wamkulu)

Correct Incorrect No response

4. Ndi cifukwa ciani Mangani anathawa galu? (Anaopa kuti galu angamulume, nyama, Anaopa, Galu wamkulu, kapena zonse izi (or all of these))

Correct Incorrect No response

5. Ndi cifukwa ciani m'bale wake anamubwereka yunifomu Mangani? (Cifukwa yunifomu yake inada, Anagwa)

Correct Incorrect No response

Student Survey

1. Kodi iweyo kapena wina wace panyumba panu ali ndi lamya(foni) (Do you or anyone in your house own a phone?)

Inde (Yes) Iyai (No)

2. Kodi ndiwe wobvomerezeka kugwiritsira nchito lamya lo(foniyo?) (Are you allowed to use the phone for calling or playing games?)

Inde (Yes) Iyai (No)

ACR GCD AGORA/CAPOLSA READING INSTRUCTION IN ZAMBIAN SCHOOLS TEACHER QUESTIONNAIRE

This research is being conducted in selected schools in Zambia. You are one of the teachers requested to participate in the GraphoGame Teacher Training Workshop organised by the Universities of Zambia and Jyväskylä of Finland under the All Children Reading: A Grand Challenge for Development with partner USAID, World Vision and the Australian Government.

Would you be willing to answer some questions? If yes, please sign here.

Your identity will not be revealed in any way during the research process and no individual information will be reported. This data will be kept in a very safe location in the University when this research process is complete. Please be truthful in answering the questions and give your personal opinion when needed.

SECTION A: PERSONAL BACKGROUND INFORMATION

Please tick your preferred response in the boxes provided.

1. What is your gender?
1. Female 2. Male
2. Date of birth : _____
3. What is your mother tongue (first language you mastered as a child)? _____
4. What language did you first learn to read in?
English Local language Both
5. If your response to the above question is local language, please specify which local language _____
6. When you were in primary school, in what grade were you able to read stories? _____
7. What is the total number of years you have been teaching? _____
8. How long have you been teaching the current grade/class in months/years? _____

19. If yes, please indicate which NGO. _____

20. Have you received any orientation on the current National Literacy Framework?

1. Yes

2. No

21. If yes, when did you receive the training? _____

22. How long was the training? _____

23. How well do you think you understood the training you received on the National Literacy Framework/Primary Literacy Program?

Very well

Relatively well

Not sure

Not at all

SECTION C: TEACHING METHODS/READING INSTRUCTION

24. Have you been able to implement the new National Literacy Framework/Primary Literacy Program in your classroom?

1. Yes

2. No

25. Which aspect of the Literacy Framework do you think you implement very well?

.....

.....

.....

.....

26. Which aspect of the Literacy framework would you like to receive additional training in?

.....

.....

.....

27. What instructional method are you using to teach initial literacy to grade 2 learners using ciNyanja?

- 1) Look and say method
- 2) Phonics method
- 3) Syllabic method

28. How well are the current teaching methods addressing the reading problems of learners in your school?

- Very well
- Relatively well
- Not sure

- Not at all

29. Which of the following order do you use to teach literacy instruction?

- Words, syllables, phonemes
- Phonemes, syllables, words
- Syllables, words, Phoneme

30. How much attention is given to the teaching of letter-sound in your school? Choose only one option.

1. Substantial time spent for teaching and everyone's knowledge is assessed regularly during teaching
2. Substantial time used to teach, but little assessment of mastery
3. Instructing starts from larger units (such as syllables)
4. Letter-sounds teaching is not needed
5. This aspect of reading instruction is much less relevant than other issues associated with the instruction of basic reading skill

31. How does your school help learners who experience challenges in acquiring basic reading skills? You may choose more than one

- I. Nothing
- II. Providing some individually tailored support
- III. Extra lessons
- Iç. Remedial work
- ç. Computer based training
- çI. Engaging reading experts

32. What is the best way to help children in early grades to read in local languages? Rank the answers in order from 1-4, from the most effective way to the least effective way. 4 being the most effective and 1 being the least effective.

1. Look at pictures and read words or sentence
2. Repeat words after the teacher has said them out loud
3. Teach the sounds of the letters
4. Guide pupils to recognise words and sentences in songs and poems or stories

33. How familiar are you with letter sounds in ciNyanja? Select one answer.

1. I don't know because I do not need letter-related knowledge in my teaching
2. I know the letter names used in English (/ei/, /bii/, /cii/.)
3. I can pronounce most of the letter-sounds
4. I know the letter names specific to the instructed writing system
5. I can pronounce all the letter-sounds of my native languages
6. I can pronounce the sounds of all those local languages which are spoken among my typical pupils

34. How much time is allocated to the teaching of literacy in your school time table per week? Indicate number of hours _____

5. Because the learners need to improve their local language use to help preserve their culture.

47. What is the greatest advantage of teaching children to read in the local languages?

1. Local languages have shorter words making it easier to learn to read.
2. Local languages are many so teachers can choose from a variety of languages.
3. Sounds, syllables and words in the local languages are pronounced exactly as they are written.
4. Sounds, syllables and words in the local languages are pronounced and written in many different exciting ways.
5. Sounds, syllables and words are easier for beginner readers in the local languages.

48. The use of the phonics based approach is better than the whole word reading approach because..... (you can choose more than one response).

1. Phonics approach is more fashionable.
2. Phonics approach focuses mainly on letters, words do not need to be taught.
3. Phonics is recommended worldwide for languages like the local languages in Zambia.
4. Phonics makes it easier to translate the spoken language into written form.
5. Phonics makes it easier to translate written language into spoken form.

49. When teaching reading in local language, what should the teacher start with.....

1. Consonants.
2. Vowels.
3. Both consonants and vowels.
4. All the simple words in the language.
5. Only words that they are familiar with the child.

50. What do you understand by the word "blending"?

1. Joining sounds together to make syllables.
2. Forming larger words from shorter ones in the local language.
3. Ability to decode words in the local language.
4. Ability to check that words are correctly connected in the local languages.
5. Ability to recognize words.

SECTION G: SUPPORTING STRUGGLING LEARNERS

Circle your preferred response

51. Why is it important to identify children with reading difficulties as early as possible? You can choose more than one response.

1. To tell the child that because of their learning difficulty they will never succeed in school.
2. To be able to provide activities that will help the child as soon as possible.
3. The earlier the teacher discovers the problem the earlier it is known if the child is worth educating.
4. The earlier the teacher discovers and tells the parents, the earlier it is possible to give the parents information about supporting their child's learning.
5. The earlier the child knows about the problem they have, the sooner they learn how to practice the skills they need to overcome their difficulties.

52. Which one of the following **are** useful in identifying learners with reading difficulties? You can choose more than one response.

1. Checking if the child has a hearing problem.
2. Checking if the child is afraid of reading tasks.
3. Observing the reading speed of the child.

4. Check that the child knows the connections between letters and spoken sounds.
5. Check that the child has made errors with similar looking letters like b and d.

53. What is phonological awareness?

1. The ability to manipulate spoken language and identify sounds.
2. The ability to recognise words.
3. The ability to comprehend texts.
4. The ability to put together different syllables to make a word.
5. The ability to know the letters of the alphabet.

54. Which of the following is a very important foundational skill for reading in ciNyanja?

1. Speaking in ciNyanja fluently.
2. Knowledge of the letter-sound connections of the alphabet in ciNyanja.
3. Knowledge of simple words in ciNyanja.
4. Knowledge of syllables in English.

55. When the child has attained fluency in reading then it means that.....

1. The child is able to read long pieces of texts.
2. The child is able to memorise long stories.
3. The child is able to read at a fast pace without making mistakes.
4. The child is able to read texts which have un-familiar words in them.
5. The child is able to recite the alphabet very quickly

56. Which of the following can be signs of reading difficulties

1. Poor letter knowledge.
2. Poor comprehension skills.
3. Poor motivation to read.
4. Poor decoding skills.
5. Poor writing skills.

SECTION H: READING STORIES

57. Why do you think listening to stories is important for learners?

58. Name any three ways you think the vocabulary of a learner can be increased.

59. Briefly explain how you would conduct a literacy lesson to grade one learners using story telling.

6. If yes, how often do you use WhatsApp?

1. At least once a day
2. At least once every week
3. At least once every fort night
4. At least once every month
5. Never

7. Have you ever attended any computer lessons? 1. Yes 2. No

8. If yes, what was the training focused on? _____

9. Do you own any of the following gadgets?

1. Desk computer
2. Tablet
3. Laptop
4. Smart Phone

10. Have you ever used the internet before? 1. Yes 2. No

11. If yes, what do you use the internet for? _____

12. Have you ever used any ICT related technology for educational purposes, e.g. preparing lessons or teaching?

1. Yes 2. No

13. What exactly did you use the technology for?

1. Typing documents
2. Playing games
3. Checking for information on the internet
4. Nothing

14. Do you think ICT training for teachers should be included in the teacher training curriculum? 1. Yes

2. No

SECTION B: SCHOOL INFRASTRUCTURE AND ICT TRAINING

15. Do you use any ICT infrastructure in your school? 1. Yes 2. No

16. If yes, which ICT infrastructure does your school have?

1. Desk computer
2. Tablet
3. Lap top
4. Smart Phone

17. Is any of the above mentioned infrastructure (chosen in 2) used for educational purposes e.g. teaching or preparing lessons in your school? 1. Yes 2. No

18. If yes, what specifically is the technology in your school used for?

27. What do you think learned in the training that was very useful for your work?
